

Postman

- Postman is a tool to send HTTP requests
- We can use this tool to test API Gateway
- Postman can HTTP GET requests to the API Gateway, which will trigger our Lambda Function and return the response
- Postman can HTTP POST requests to the API Gateway, which will also trigger our Lambda Function and return the response
- Our Lambda Function handles a POST request by finding the "name" field in the associated event and storing that name in Redis
- Our Lambda Function handles a GET request by reading whatever name is stored in Redis
- To send a POST request, we need to use the **body** tab and the **raw** option
