

In this exercise, you will connect API Gateway with Lambda via a trigger.

API Gateway will, in effect, become a serverless webserver that connects to our `hello` Lambda Function.

Instructions

- Add an **API Gateway** trigger in Lambda using a **REST API**
- API Gateway Security should be **open**
- You should be able to set and get the `name` field using the API Gateway invocation URL with the request body

```
{"name": "greatest student ever"}
```
